

I tested my website in Chrome, Edge, and Safari to see how it held up across different browsers. Chrome and Edge were pretty similar, with only small differences in text rendering and spacing. But Safari was a different story!.

One of the bigger issues in Safari was how it displayed form elements. Spacing was off and the radio buttons weren't lining up the same way they did in Chrome and Edge. Some layout elements, like background images and content positioning, also looked a little off, which made the design feel less consistent. That said, everything still worked fine across all three browsers.

I also ran into a problem when trying to take a full-page screenshot. No matter what I tried, I couldn't get the background to extend all the way down or tile properly in the screenshot—even though it looked just fine in the browsers. I played around with the CSS to fix it, but nothing seemed to work.

Overall, the site functions well across browsers, but Safari definitely threw in some quirks. These differences are a good reminder that cross-browser testing is important.
